Publication Date: 1960

Chapter Title: Measures of Experience over Chronological Periods

Chapter Author: W. Braddock Hickman

Chapter URL: <http://www.nber.org/chapters/c2467>

Chapter pages in book: (p. 288 - 379)

SECTION IV

Measures of Experience over Chronological Periods

TABLES throughout the remainder of the book relate to the experience records of straight corporate bonds held over various assumed investment periods, classified by selected characteristics at the beginning of the respective periods. Tables in this section pertain to the records of outstanding issues held over the four-year periods 1900-1903, 1904-07, . . . , 1940-43, and selected combinations of the basic four-year periods, e.g., 1900-1907, 1900-1919, and so on. (The chronological periods covered are listed in the stubs of the tables; a description of the method of selecting them is given in *Corporate Bond Quality*, Chapter 1.) Tables in later sections relate to investment experience over selected natural periods of investment, such as, for example, the period from offering to extinguishment and from offering to default.

The three basic measures used in these studies to record corporate bond experience over selected periods are the realized yield, the loss rate, and the default rate. The realized yield is the annual rate of return received over a specified investment period (chronological periods in this section; natural periods in the sections to follow), after taking account of call premiums, default losses, and so on. It is a retrospective measure of bond performance, in contrast to the promised yields presented in ordinary tables of bond values, which are prospective measures calculated on the assumption that an issue will be retired by payment in full at maturity, with no prior delay or default in the payment of interest.

Our second basic measure of bond experience is the loss rate, or the difference between the promised yield to maturity and the yield realized over an assumed investment period. Since bonds are amortized on the books of most investors on the basis of the promised yield to maturity, the loss rate over any assumed period of investment measures the extent of the capital loss or gain (annual rate of capital loss if positive; annual rate of capital gain if negative). Assume, for example, a bond purchased at the beginning of one of our chronological investment periods to yield four percent to maturity (promised yield, four percent), and sold at the end of that period at a price yielding the investor three percent over the investment period (realized yield, three percent). Then, if the bond were amortized in the usual way at four percent, the annual rate of capital loss would be one percent (loss rate, one percent). The yield tables of this section present weighted average promised yields and realized yields, with par amounts of the

included outstandings as weights. Loss rates are not presented, but may be obtained by subtraction. Details on interpretation and method of computation of the promised yields, realized yields, and loss rates are given in Chapter 1 of *Corporate Bond Quality* and in the Technical Note to that chapter.

The default rate, which is the third basic measure of investor experience, is simply the ratio of the par amount (or number) of issues going into default during an assumed investment period to the amount "eligible" or "liable" to go into default at the beginning of that period (in this section, the amount of outstanding issues that was not in default at the beginning of one of the chronological investment periods). In *Corporate Bond Quality*, several tables present default rates based on bond outstandings, and these tables are not repeated here. (For cross-references to such tables see the Table of Contents of this report.) Rather, supplementary tables showing the detailed default and extinguishment record of the issues over the assumed investment periods are presented for a few key variables. Default rates can be derived from these tables, as well as the frequency of different methods of extinguishment.

The tables contained in this section are thus of three basic types:

- (1) Yields (promised and realized) over four-year and longer periods of investment 1900-1943, classified by the distributing variable at the beginning of the periods (or occasionally at offering), by size of issue (large and small), and by major industry group for large issues, with relevant par amounts (e.g., Table 166 for agency rating).
- (2) Par amount of issues outstanding quadrennially 1900-1943 and rated high and low grade under selected quality measures (agency rating, market rating, legal status), classified by default and extinguishment status during four-year periods and by major industry group (e.g., Table 167 for agency rating).
- (3) Par amount of large issues outstanding quadrennially 1900-1943 and rated high and low grade under selected quality measures, classified by default and extinguishment status during four-year periods (e.g., Table 168 for agency rating).

Corresponding tables are presented under Coverage (Tables 163-165), showing global yields and default and extinguishment status on all outstandings included

in the study, but not classified by the distributing variables.

Each of the yield tables (the first type mentioned above) contains three sections or panels: weighted average promised yields, weighted average realized yields, and the par-amount weights. The par-amount weights may be used to obtain weighted promised yields, realized yields, and loss rates for groups other than those shown in the tables. For example, the weighted average realized yield of issues with composite agency rating grades I and II (cf. Table 166) purchased at the beginning and sold at the end of the investment period January 1, 1912–December 31, 1915 is obtained by weighting the yields of the issues rated I and II (3.1 percent and 2.7 percent, respectively) by the relevant par amounts of outstandings included in the yield averages (\$3,402.1 million and \$1,609.9 million) to obtain the yield of 3.0 percent for the combined group of issues rated I and II. The corresponding promised yield for this group is 4.3 percent, and the loss rate is 1.3 percent.

The yield tables include only issues in the so-called periodic experience samples: that is, only large issues and those in the 10 percent sample of small issues for which realized yields could be computed over the four-year and longer periods. Only issues that had a contractual maturity date later than the end of a period are included in that period, regardless of when they were actually extinguished. (Realized yields could not be given, of course, for periods beginning with 1944. But promised yields for issues outstanding January 1, 1944 are given, covering those that had a term to maturity of one or more years.) To compute the realized yield, market prices at the beginning and end of an assumed investment period were needed, as well as the full record of cash receipts throughout the specified period. This information could not be determined for all periods and for each issue in the sample studied (that is, all large issues and the controlled 10 percent sample of small issues). Generally speaking, such information was more difficult to obtain for small issues than for large, and for earlier than for later periods. Moreover, information needed to compute the realized yields was generally more difficult to obtain for defaulted than for nondefaulted issues, and particularly for the 10 percent sample of small issues. There is some question as to the representativeness of the averages presented for the small issues for some of the earlier periods.

The problem of bias resulting from incomplete coverage is discussed in Chapter 1 of *Corporate Bond Quality*. On the basis of that discussion, the decision was reached to present separate yield averages for the large and small issues in the bond experience sample,

using one as a check against the other, but not to present universe yield estimates for the total of all issues. That procedure has been followed in this report as well. Separate yield averages are presented for large issues and for small issues, and by major industry groups for large issues, where the data are reasonably complete for most periods. Footnotes to the par-amount sections of the yield tables indicate cells containing less than five issues (in both the large- and small-issues sections); these footnotes are equally applicable to the promised and realized yields in the first and second panels of the tables.

The reader may, if he wishes, combine the data for large issues and small by applying appropriate weighting factors given in the corresponding tables of the first section of this report. For example, as Tables 2 and 3 indicate, \$3,552.7 million of large issues had composite agency rating Grade I in 1912, and \$563.6 million of small issues. Applying these weights to the corresponding realized yields during 1912-15 for large and small issues, 3.1 percent and 3.7 percent respectively, we obtain an estimate of the realized yield of all issues outstanding at the beginning of that period: 3.2 percent. Some idea as to the reliability of this estimate may be obtained by comparing the size of the experience samples, as measured by the par amounts included (Table 166), with the corresponding universe estimates given in Tables 2 and 3. Additional information on the reliability of such estimates is presented in Table 163 in the section on coverage, which contains for all issues in the experience samples the yields over the assumed investment periods, classified by major industry group within size of issue class, and the number of issues and par-amount totals included in these samples. Such estimates are more accurate for the later periods of the study, where the data are more complete and the large issues are more important in the par-amount totals.

Tables of the second and third types mentioned above, showing the default and extinguishment status of all issues and of all large issues during the chronological periods 1900-1903, and so on, are presented in this section for a few key distributing variables (coverage, agency rating, legal status, and market rating). The tables on default and extinguishment status indicate the par-amount totals of issues outstanding at the beginning of the quadrennial periods, the amount in default, and the distribution of those in good standing according to whether they defaulted during the periods, were extinguished by noncontractual exchange, or were in good standing throughout the periods. Issues going into default during the periods are further classified by whether they were extinguished by cash payment or exchange for successor

securities, or were still outstanding at the end of the periods. Noncontractual exchanges before maturity are presented as a separate class. These are issues extinguished by exchange for other securities or by contract modification, where no technical default had occurred, but where the new (or modified) securities were worth less than par at the date of exchange. Noncontractual exchanges are virtual defaults and have been treated as such in computing default rates throughout these studies. Issues in good standing during the periods are classified in the default and extinguishment tables into those outstanding at the end of the period, and those extinguished by payment in full at maturity, by call, and by other methods (conversion, exchanges where the new securities were worth par or more, and so forth). A separate column indicates issues for which default and extinguishment status could not be determined.

Since the par amount of issues for which default and extinguishment status is unknown is relatively small, it was possible to provide reliable universe estimates for all issues by adjusting the 10 percent sample of small issues within major industry group and combining with the corresponding figures for large issues. The par-amount totals in the tables thus agree with the totals of outstandings as shown in the first section of this report (compare, for example, the par amount of issues with composite agency rating I-IV in Tables 2 and 167). Cells consisting partly or entirely of small issues are marked by footnotes if the

number of issues they contain (before conversion to universe totals) is less than five. Because of space limitations, number figures are omitted from the tables on default and extinguishment status, but otherwise the structure of the tables is similar to those presented for outstanding issues in the first section of this report. That is, the tables show default and extinguishment status of all issues by major industry group, and of all large issues (not classified by major industry).

Weighted average default rates (based on par amounts) and the frequencies of the various types of defaults and extinguishments can be computed from the default and extinguishment tables. For example, of the \$7,696.0 million par amount of issues rated I-IV by the investment agencies at the beginning of the period 1912-15 for which the default and extinguishment status was known, \$540.5 million, or 7 percent, went into default before the end of the period (the sum of noncontractual exchanges and of issues defaulting during the period that were extinguished by cash payment or exchange or were still outstanding at the end of the period). The corresponding default rate for issues rated V-IX by the investment agencies during the period 1912-15 is 49 percent. Quadrennial default rates constructed in this fashion are presented in *Corporate Bond Quality* for a number of variables (for example, Table 35 on agency rating). Cross-references to such tables are given in the Table of Contents.

TABLE 163—Yields over Four-year and Longer Periods of Investment 1900-1943, Classified by Size of Issue and Major Industry Group, with Number and Par Amount of Issues in Each Class (dollar figures in millions)

^aThe New York legal list did not contain public utility issues until 1928 except for securities of the Manhattan Elevated Railway Company, which the Attorney General ruled was a railroad for bond investment purposes. In this study the company is classified as a public utility.

^bIndicates that the underlying sample data with known default and extinguishment status (before adjustment to universe totals) contain less than five issues.

Issues for which market rating could not be determined were automatically excluded from the periodic experience sample. Thus the table contains no bonds without a rating.

^a Based on less than five issues.

^b Excludes issues maturing within one year because basic yields were not determined for such short maturities.

TABLE 174—Par Amount of Issues Outstanding Quadrennially 1900-1943 and Rated High and Low by the Market, Classified by Default and Extinction Status during Four-year Periods and by Major Industry Group (millions of dollars)

Period	Total	In Default, Beginning of Period	Total with Known Status during Period	In Good Standing, Beginning of Period										Outstanding, End of Period	Status during Period	Unknown
				Defaults during Period			Noncontractual Exchanges and Contract Modifications before Maturity	In Good Standing during Period								
				Extinguished by		Outstanding, End of Period		Extinguished by								
				Cash Payment	Exchange			Payment Full at Maturity	Call	Other Methods
